Active Passive Heating Systems

A maintenance free collection unit where the interior element collects and stores heat from exposure to the sun. This stored heat is then transferred from the interior of the unit and blown via fan into a specified location to assist in warming the temperature.

This is free heat helping to create a comfortable environment!

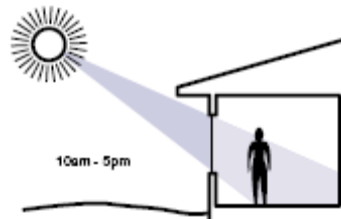

The unit fans can be run off household current or self-contained solar photovoltaic panels.

Passive Solar Heating;

It's **Warmth**
from the **SUN**

Heat Storage

Thermal mass (materials used to store heat) is an integral part of most passive solar system designs.

Simple materials such as concrete, masonry, wallboard, and even water can be used to absorb heat on sunlit days. They can then slowly release the heat as the temperature drops. Combine air flow circulation methods (such as a fan powered by solar photovoltaic panels) and now your talking free heat!

Building a new home or business? Or wanting to incorporate alternative energy into your existing home or office?

We can do it for you!

- Solar Hot Water Heating
- Solar Photovoltaic Panels
- Passive Solar System Integration

We take pride in being able to bring **solar** to **your** life.
